

variogram / triangle demo

EW

11/6/2021

We can fit the variogram in `gstat`,

```
library(gstat)
# fit a logistic regression
haul_new$present = ifelse(haul_new$cpue_kg_km2>0,1,0)
g <- glm(present ~ 1, data=haul_new, family="binomial")
haul_new$pearson = residuals(g,type="pearson")
# variogram
vg1 <- variogram(pearson ~ 1, locations = ~ X+Y, data=haul_new,
                 cressie=TRUE)
plot(vg1)
```

We could do the same thing for the postivie model

```
haul_new = dplyr::filter(haul_new, cpue_kg_km2>0)
g <- glm(cpue_kg_km2 ~ 1, data=haul_new, family="Gamma")
haul_new$pearson = residuals(g,type="pearson")
# variogram
vg2 <- variogram(pearson ~ 1, locations = ~ X+Y, data=haul_new,
```

```
plot(vg2)
      cressie=TRUE)
```
